Plan

1. TIB
2. DuraArk Project
3. Digital preservation and 3D architectural data

Goal

Issue

Use Cases

Perspectives

TECHNISCHE INFORMATIONSBIBLIOTHEK (TIB)

The TIB

- German National Library for Architecture, Chemistry, Computer Science, Engineering, Mathematics, Physics, and Technology
 - Collection scope of a national library
- World's Largest Specialist Library for Science and Technology
- Customers in more than 60 countries
- Founded 1959 - on the basis of an existing university library (founded 1831)

Services

- GetInfo - Portal for Science and Technology
- Full Text Orders - print and digital
 - National and Alliance Licenses
 - Pay-per-View
 - Customized Solutions
- DOI-Service
 - DOIs assignment in cooperation with data centers for research data, grey literature, reports etc.
- Competence Center for non-textual materials

Services

- Collect, curate and preserve materials related to the history and practice of architecture and design
- Expand the scientific information to be archived to audio-visual media and 3D models.
- Build up expertise in the area of non-textual materials in conjunction with establishing a Competence Center for non-textual materials.
- Systematic acquisition of scientific objects, object specific search and presentation, long-term archiving, development of standards...

Services

- Mostly analog records like building design drawings, Blueprints, specifications, etc., were archived
- Current challenge : Long-term Preservation systems for novel digital data types often aggregating different data entities into one object.
- Mainly for 3D architectural data

PROBADO

- Content based retrieval methods for an architectural archiving system were developed.
- Funded by the German Research Foundation (DFG) that took place from 2006 to 2011.
- Amongst others, its goal was to integrate 3D architectural models into the librarian process chain.

A step toward the Long-term Preservation of 3D architectural data

Goals & challenges (1/2)

Goal

- Development of methods and tools for **sustainable** long-term **preservation** of **architectural 3D models**

Challenges

- **Building evolution:** documentation to prevent information loss and enable repair
- **Long-term readability /renderability of 3D architectural models:** addressing digital decay due to deprecated file formats
- **Inconsistent naming conventions:** improving architectural metadata schemes & vocabularies towards long-term sustainability

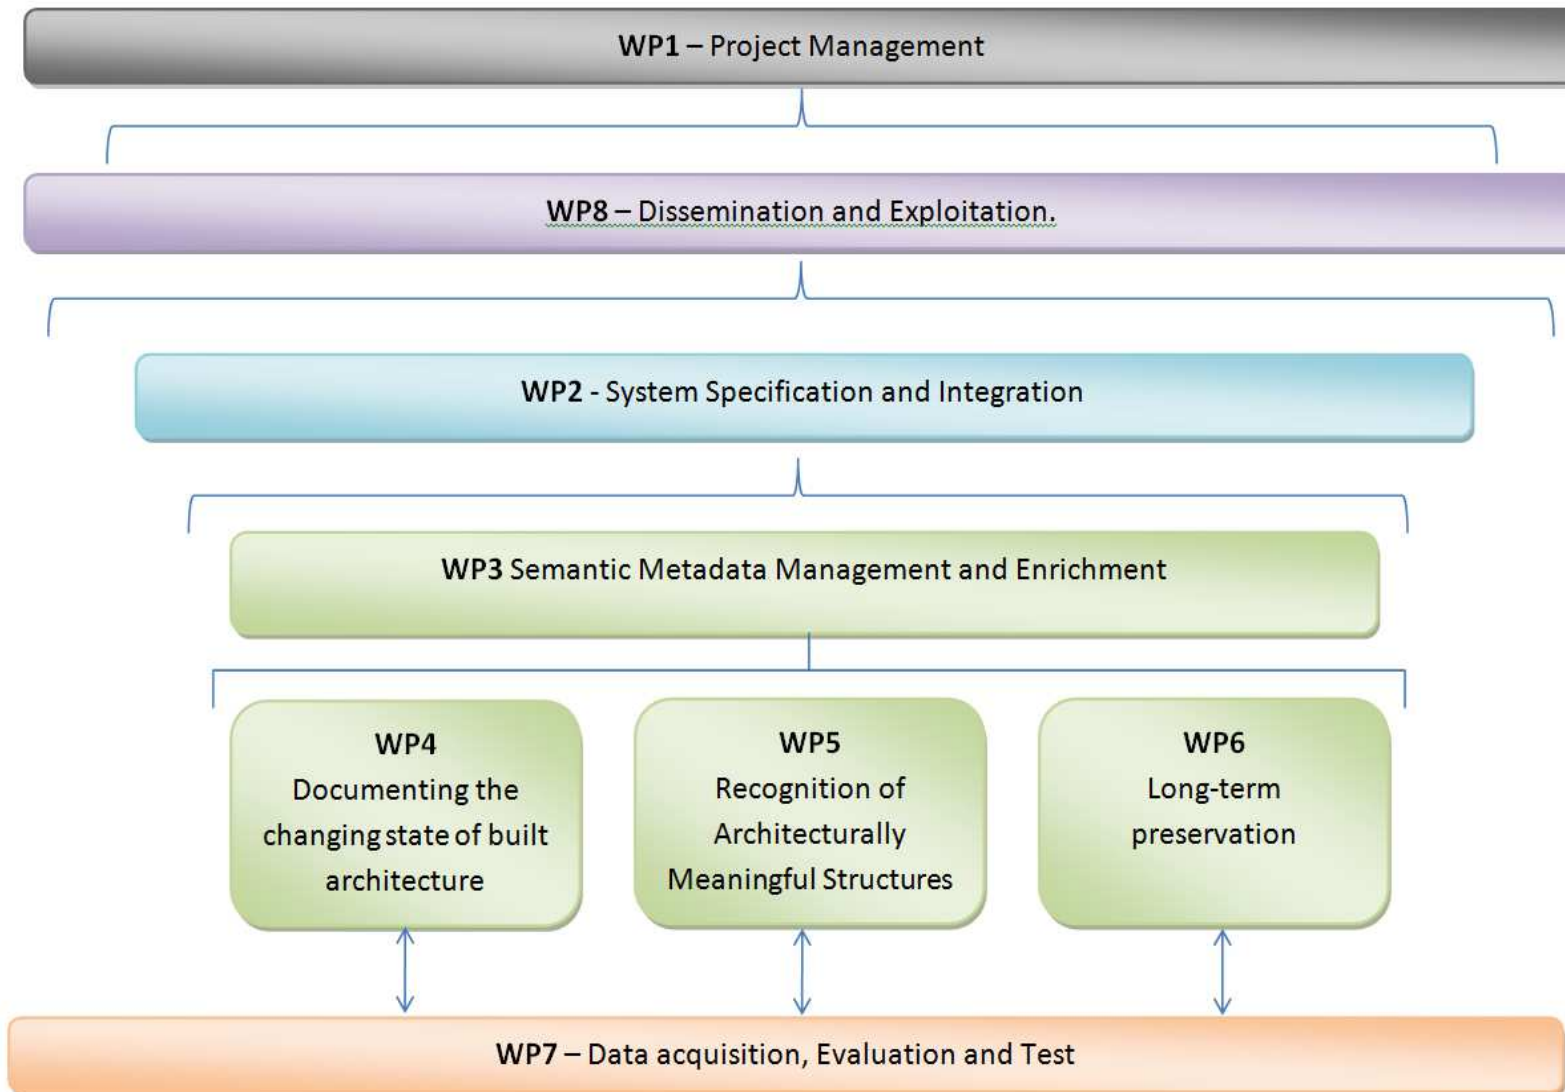

Goals & challenges (2/2)

Challenges

- **Interoperability and consistency:** bridging between diverse formats and abstraction levels (point clouds & legacy 3D models => enriched Building Information Models, BIM...)
- **Enrichment of point clouds:** using semantics to efficiently store and discover point cloud and 3D models for targeted retrieval.
- **Diversity of stakeholders:** taking into account requirements of libraries/archives, building constructors/architects, building operators, etc. on long-term archiving.

Work Packages

Consortium

Scientific excellence in three strategic areas:

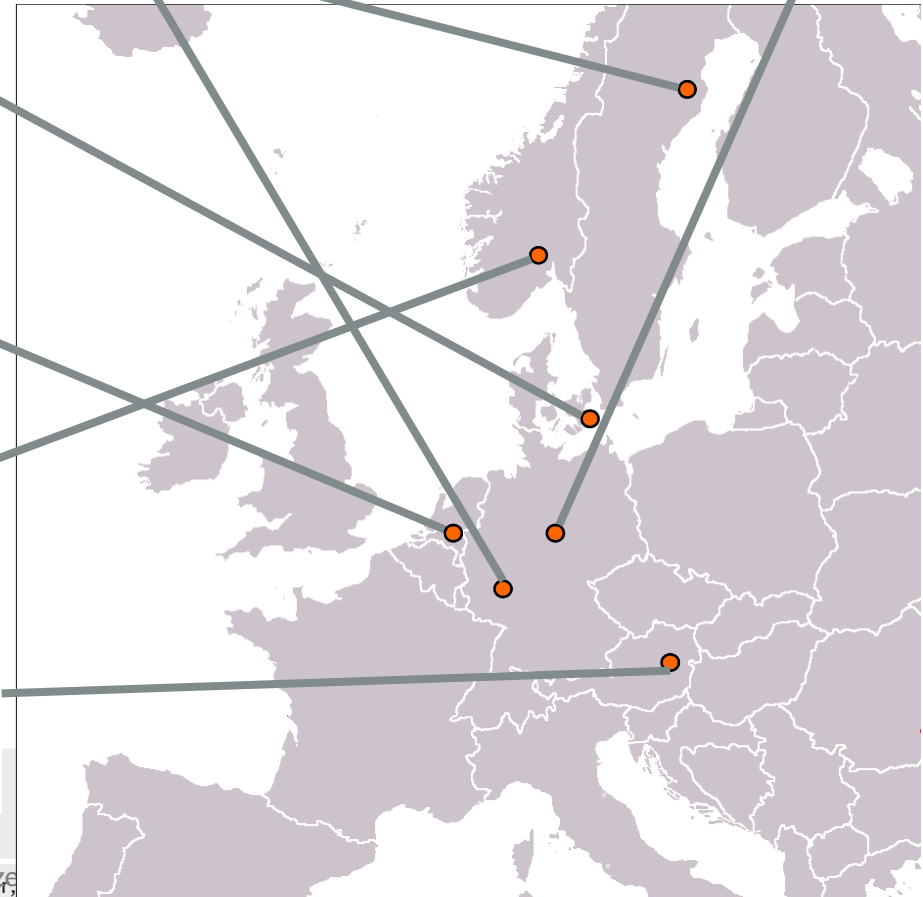

▪ Long-term preservation & archiving

▪ Architectural & 3D models

▪ Data & system integration & management

TIB |

DuraArk

UBO: Universität Bonn
 - Technical Director
 - WP4/WP5: change management, shape recognition

Luleå University of Technology
 - WP8 leader, dissemination/exploitation

CITA, Center for Information Technology and Architecture Copenhagen
 - WP7 leader, evaluation, test

TUE, Department of the Built Environment, Eindhoven University of Technology
 - WP3 leader, semantics & metadata

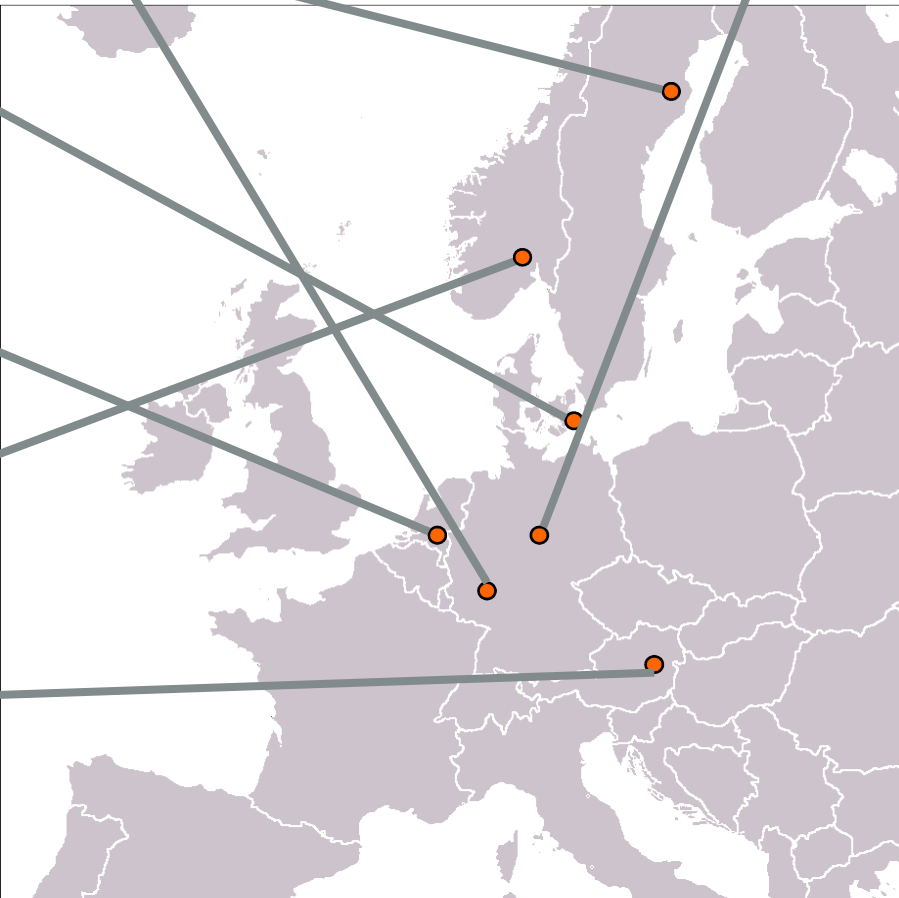

Catenda, SME
 - User perspective, market requirements, evaluation

Fraunhofer Austria
 - WP2 leader, system specification & integration

LUH: German National Library of Science and Technology (TIB) & L3S Research Center Hannover
 - Coordinator
 - WP6 leader, long-term preservation

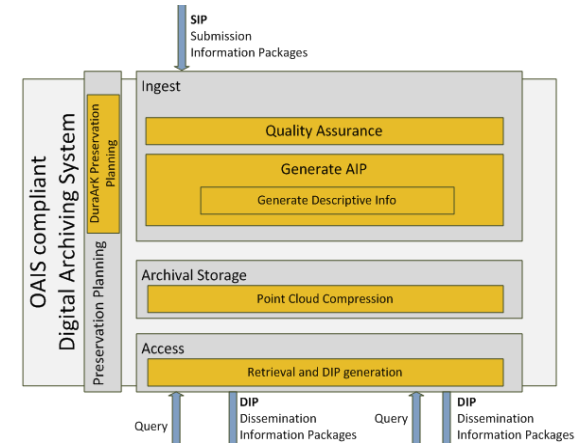

DuraArk

Tangible outcomes

Tangible outcomes

- **Workflows and tools for OAIS compliant ingest:** Management, preservation and delivery of the various types of architectural data
- **Semantic enrichment:** Vocabularies for description of built structures and enrichment techniques based on a unified and sustainable naming scheme
- **Tools for structuring of point clouds and legacy 3D data:** Enable targeted retrieval by detecting high-level semantic structures in the data

Tangible outcomes

Tangible outcomes

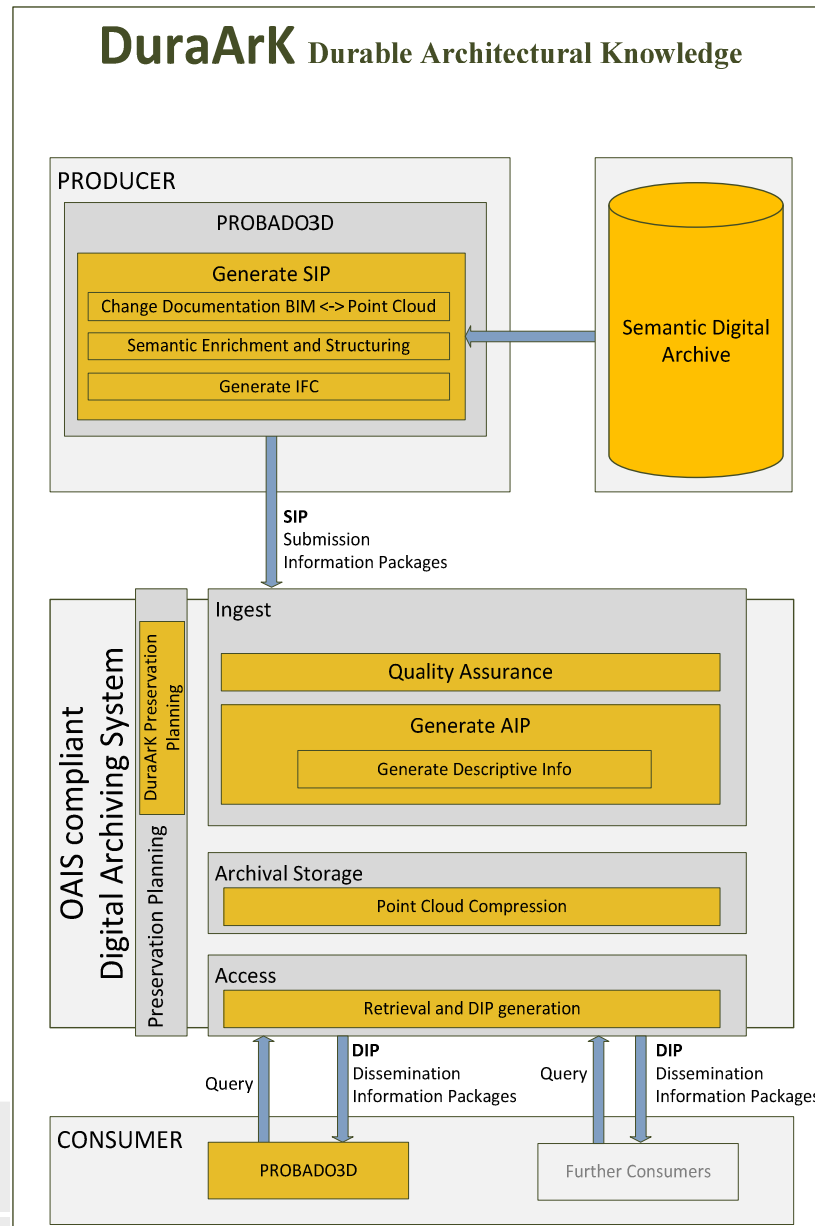

- **Tools for detection of changes in the building:** Avoid information loss by detecting differences in original building plans and point clouds documenting the as-is building state to enable guided repair
- **OAIS compliant storage:** Face problem of digital decay by using Industry Foundation Classes (IFC) as an open and already well-established file format suited for long-term preservation. Use point cloud compression techniques that are self-documenting and robust towards bit rot.
- **Tailored Workflows:** Thoroughly investigate requirements of institutional stakeholders (libraries/archives) and SMEs on long-term archiving. Develop according workflows.

Aligned 3D model and laser scan

Architecture

Digital preservation and 3D architectural data

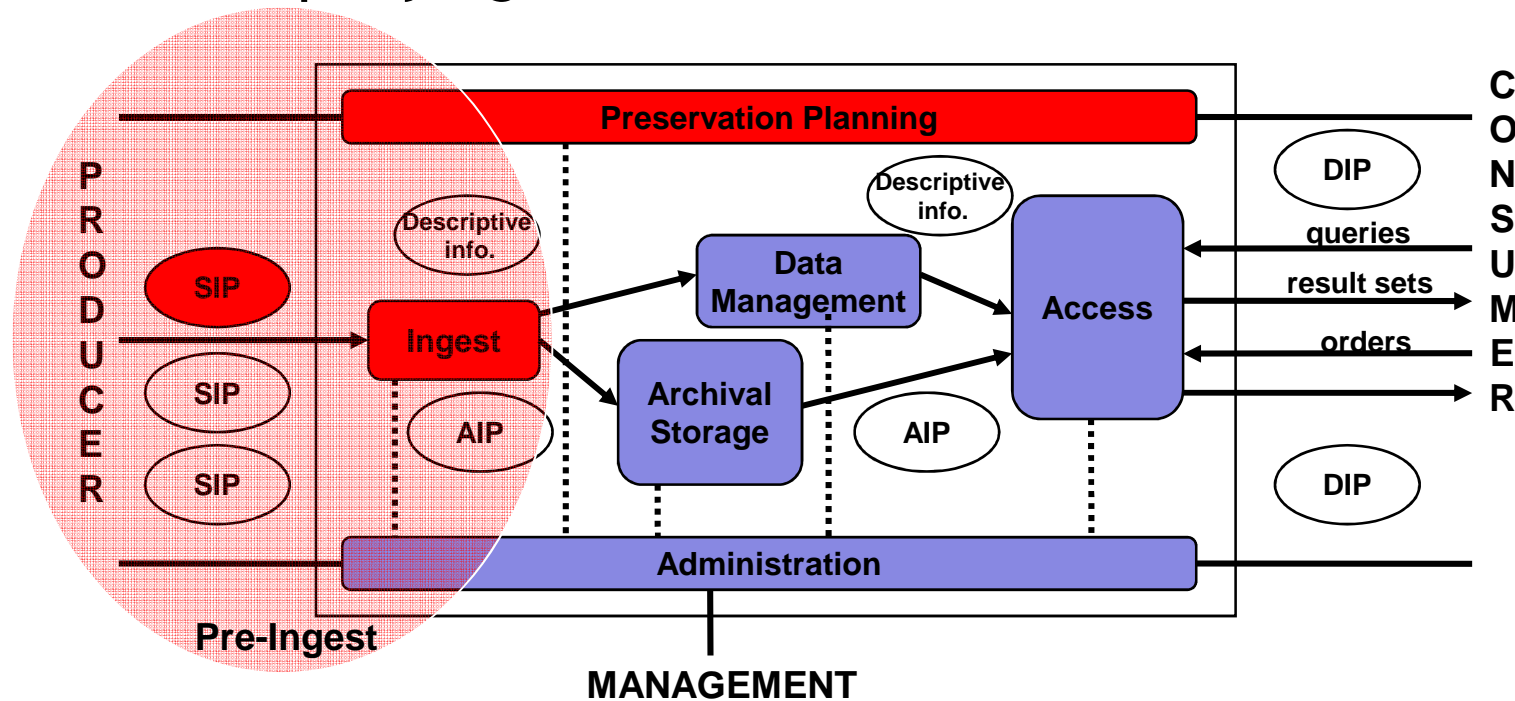

Goals

- Creating technology solutions and innovative methods for keeping 3D architectural data available and useable over time
- Implement approach based on the OAIS model to support the 3D architectural data
- OAIS
 - Archive consisting of organization, people and systems
 - The primary goal of an OAIS is to preserve information for a designated community over an indefinite period of time.
 - OAIS must store significant information about the object and its contents.

The Pre-Ingest \ Ingest Process

- Prepare the contents of a SIP for storage and management comprises
 - The 3D architectural data
 - Its accompanying metadata

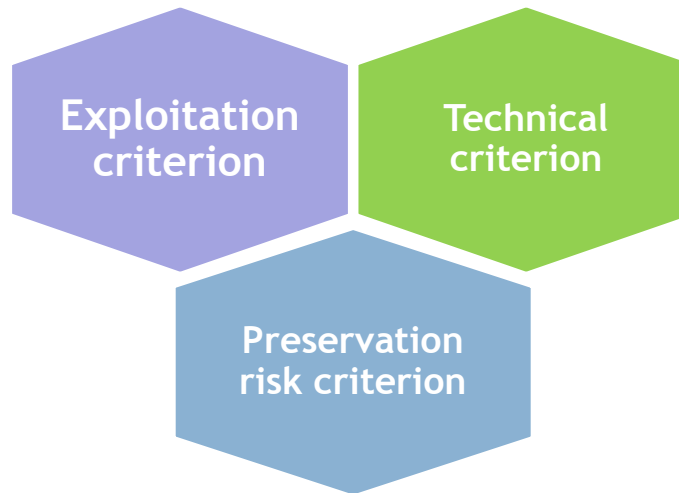

The 3D architectural data

- Be based on the Industry Foundation Classes (IFC)
- Study and suggest different criterion to evaluate 3D data structure and their related risk for preservation purpose.
- Study several kinds of 3D data structure add to the IFC and evaluate it based on the selected criterions (CAD, IFD, WRL...)

The 3D architectural data

- End user able to access, visualize, manipulate the content
- Future user should be able to interact with the data (3D)
- Simplicity: understand, manipulation

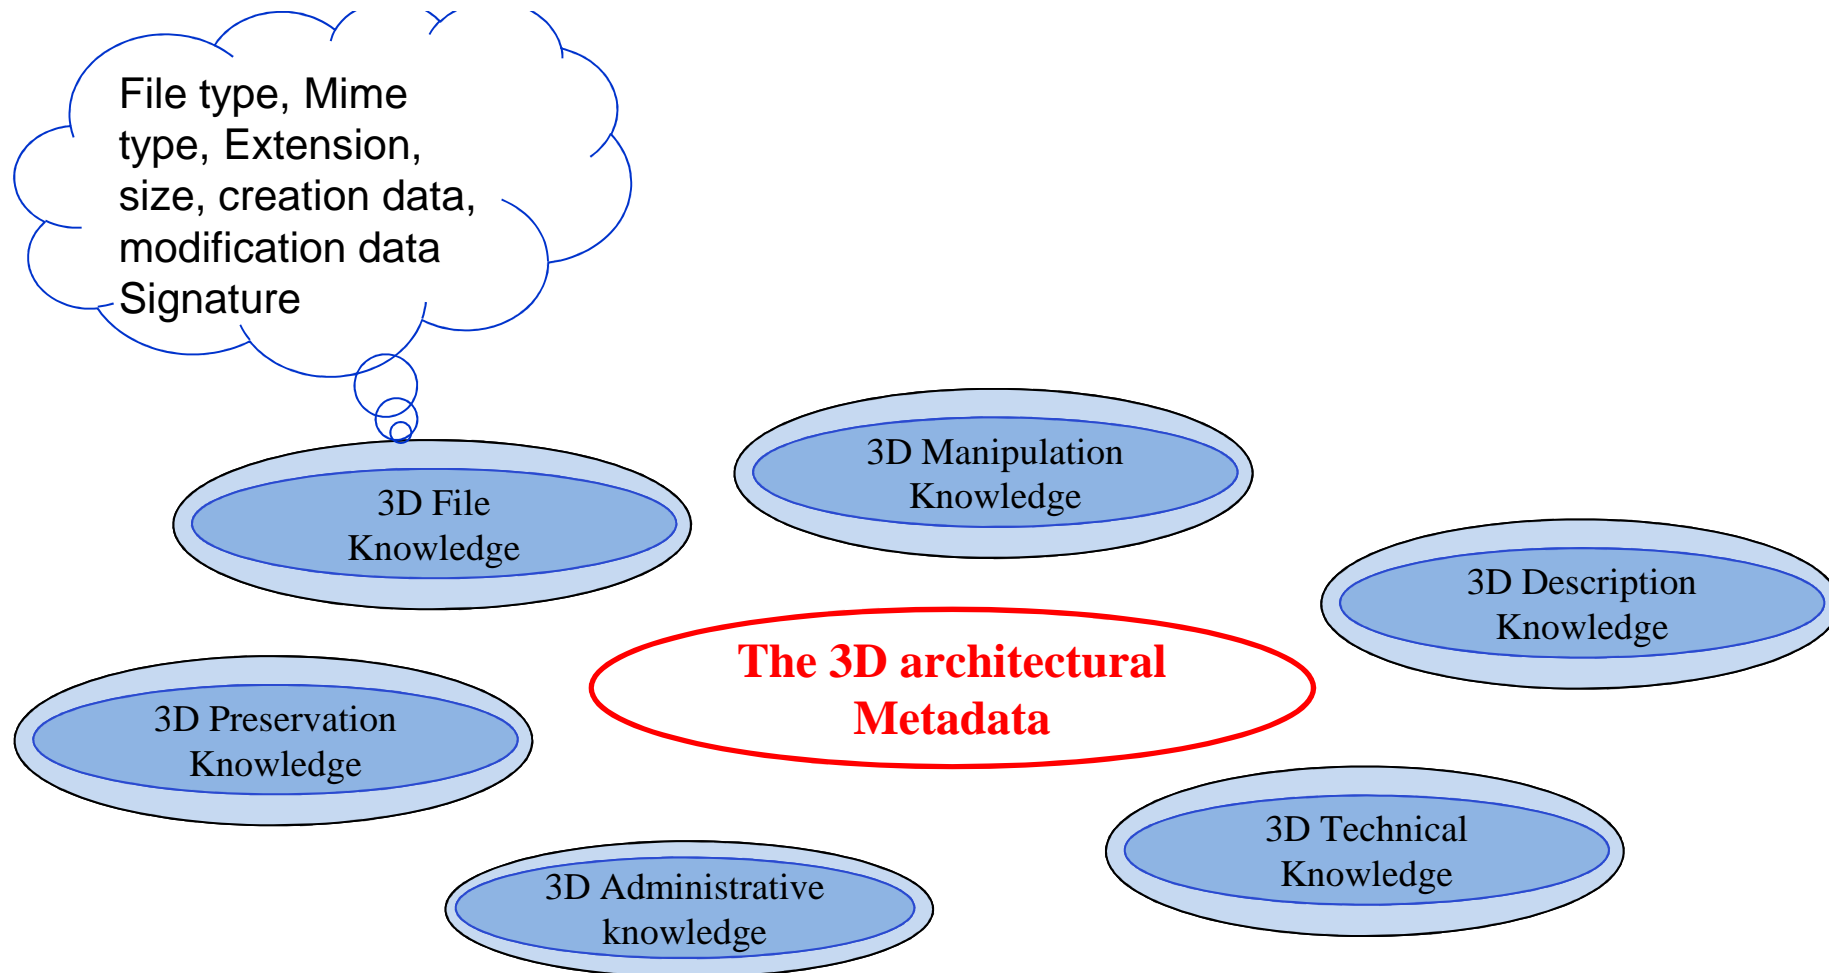

- Open File Format
- Compatible with software and plugins
- Independent from software
- Standardisation
- Display speed

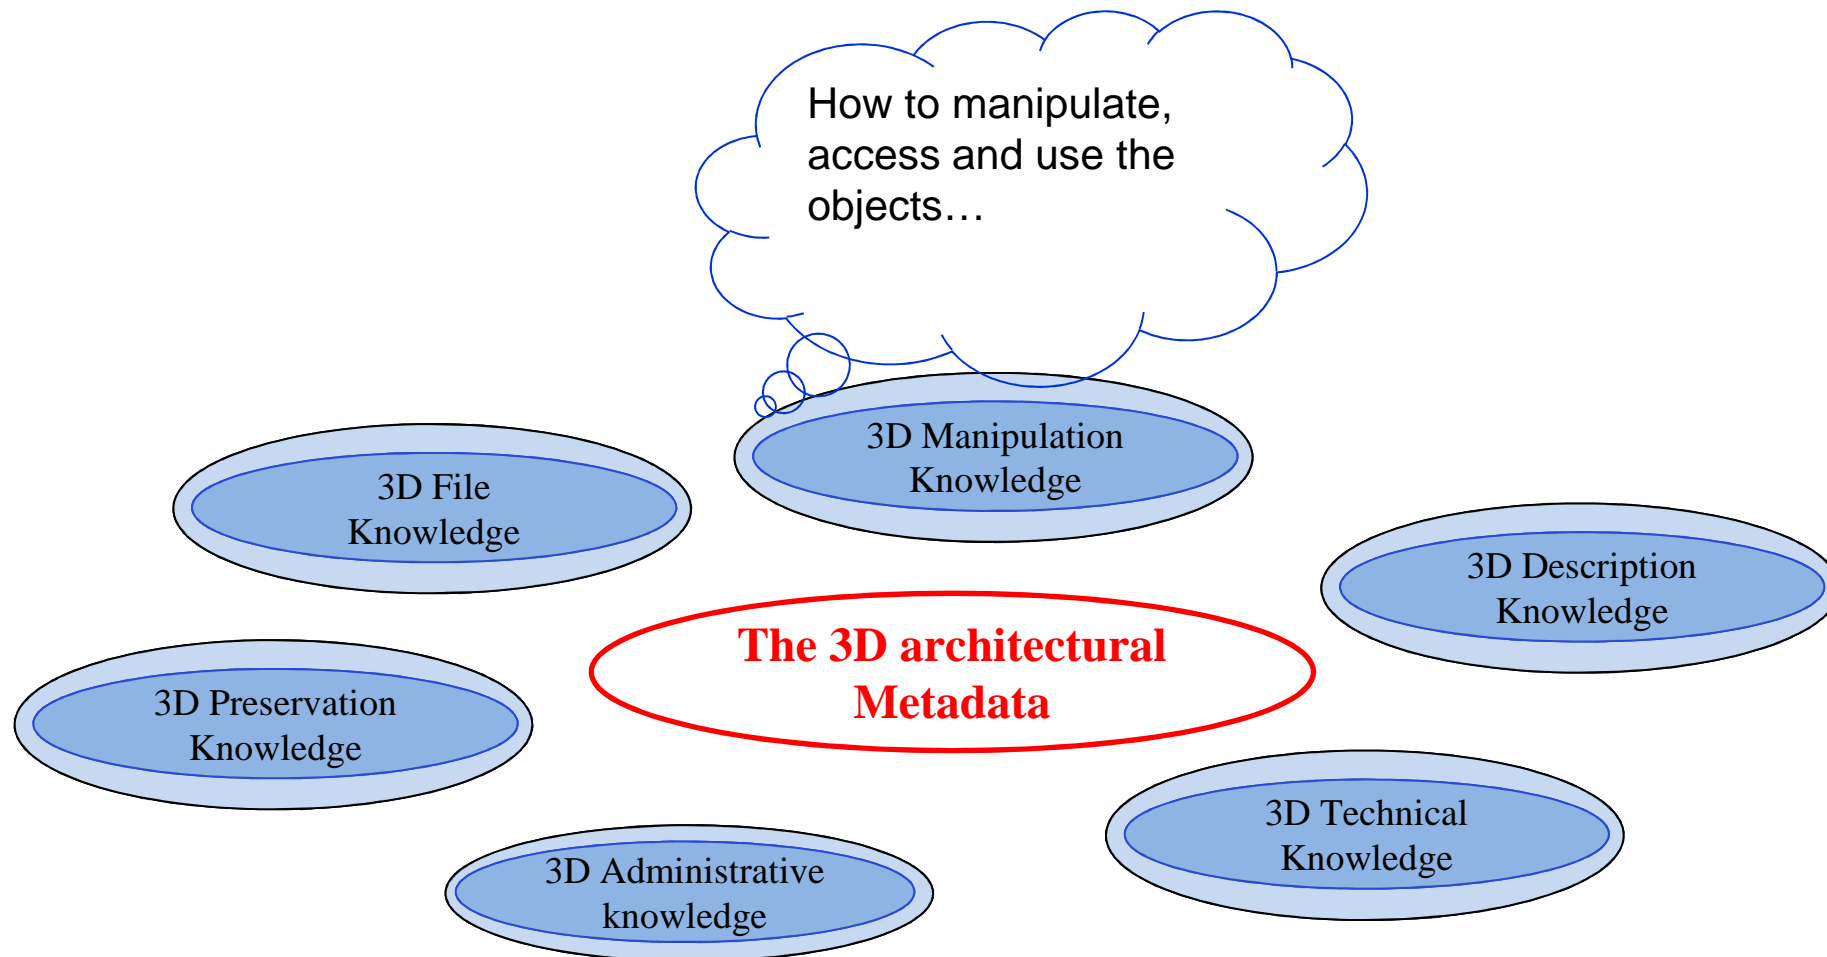

- Duration of support
- Open specification
- Able to access on future computer

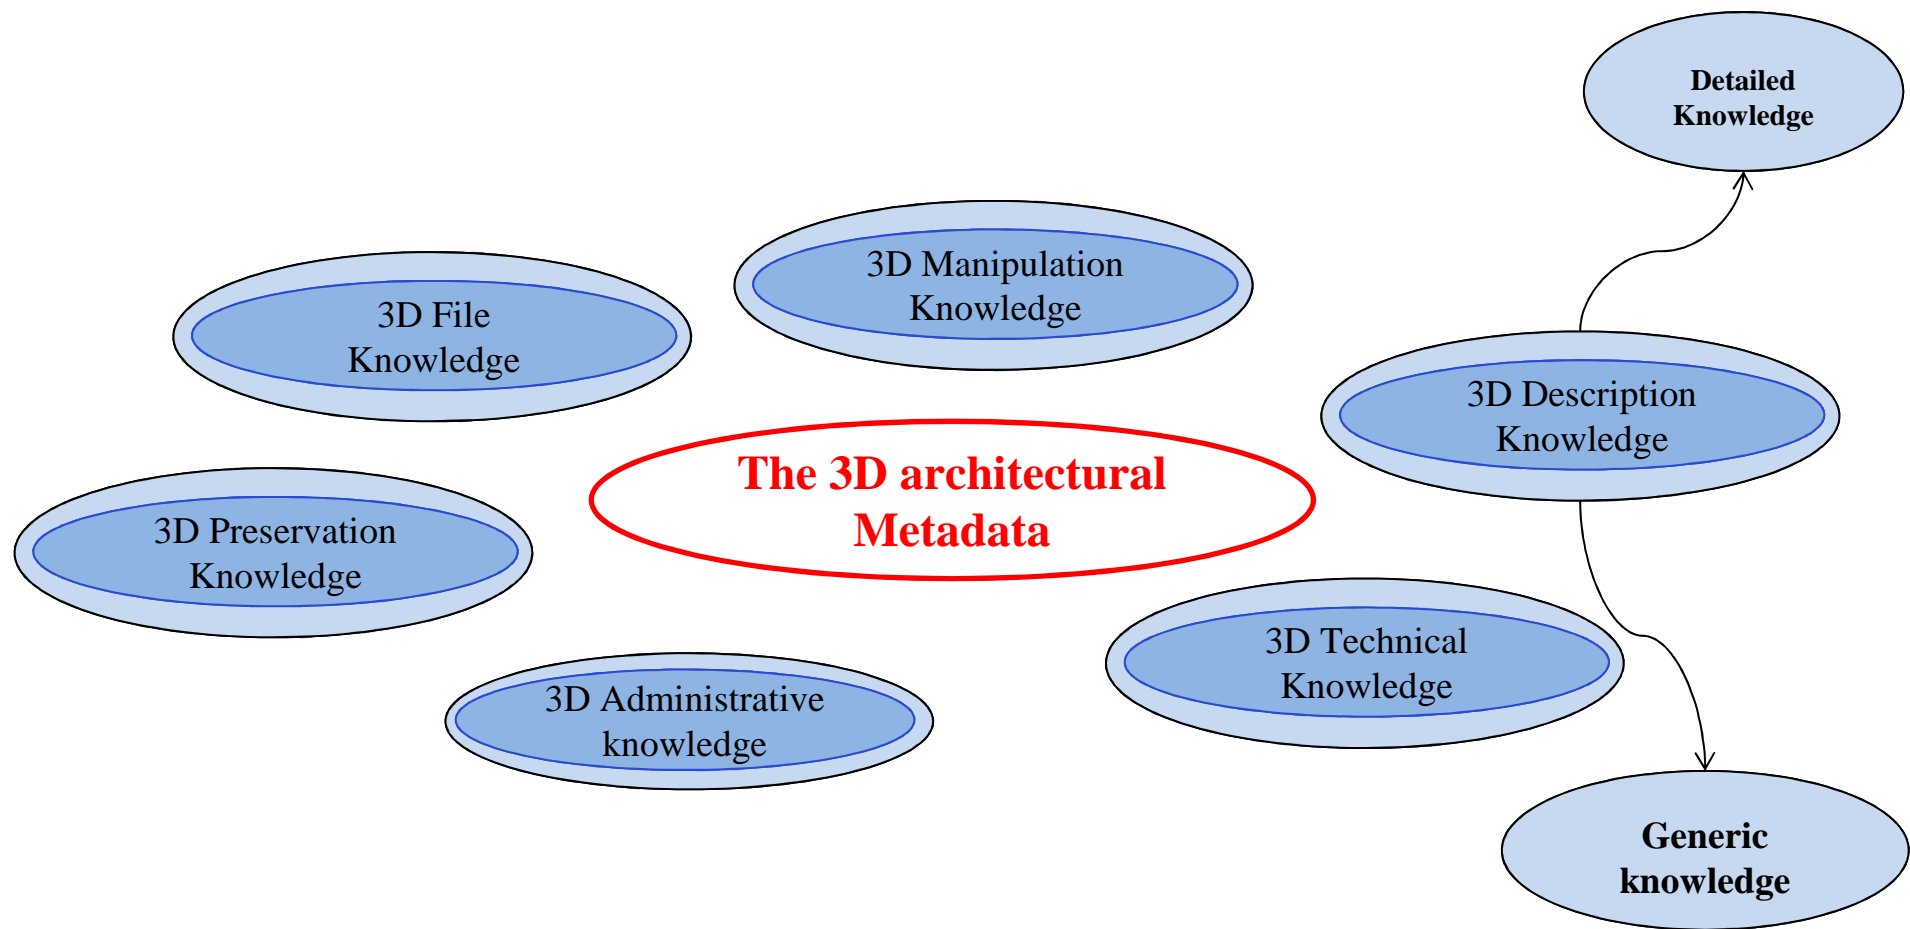

The 3D architectural Metadata

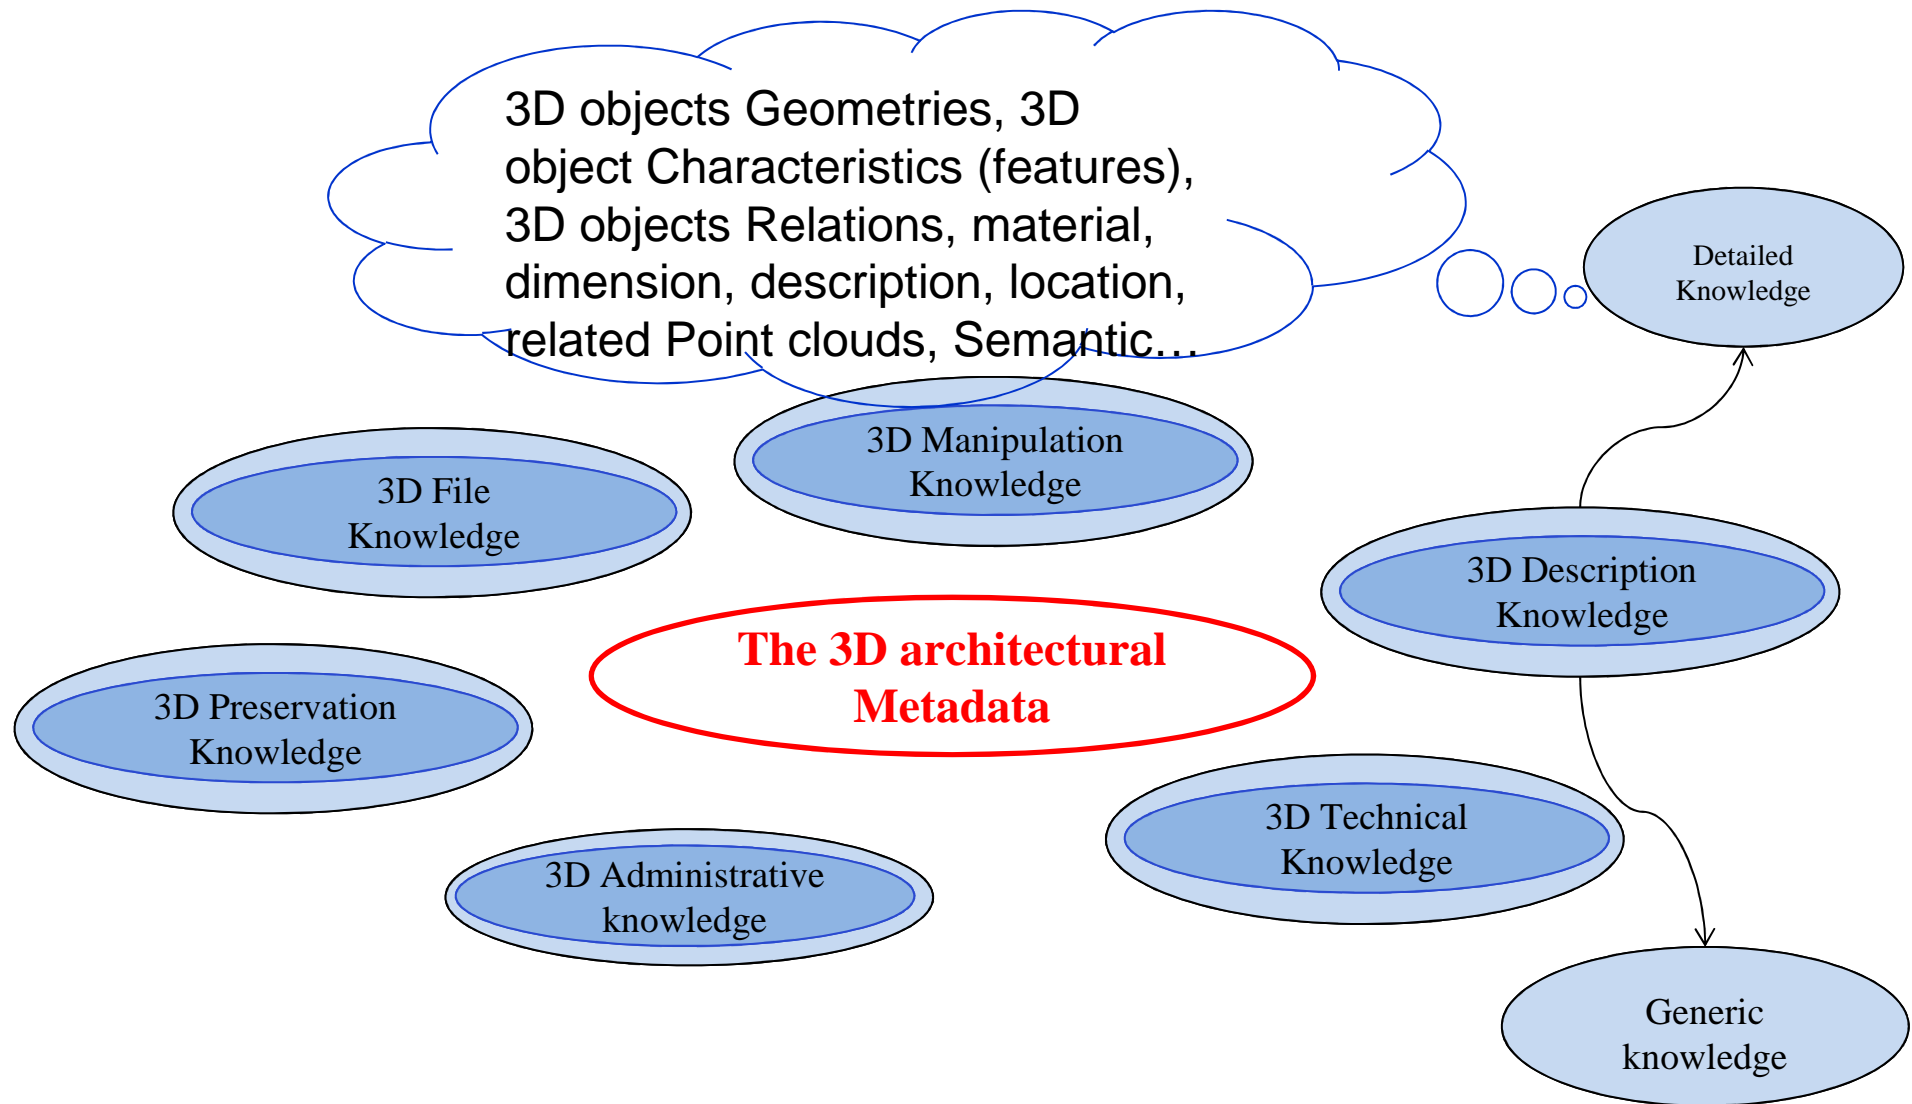

- Study which kind of information should we preserve for the 3D architectural data
- Study and evaluation of existing metadata schemas towards their feasibility for our purpose
- Try to adapt/update existing standards to support new 3D information

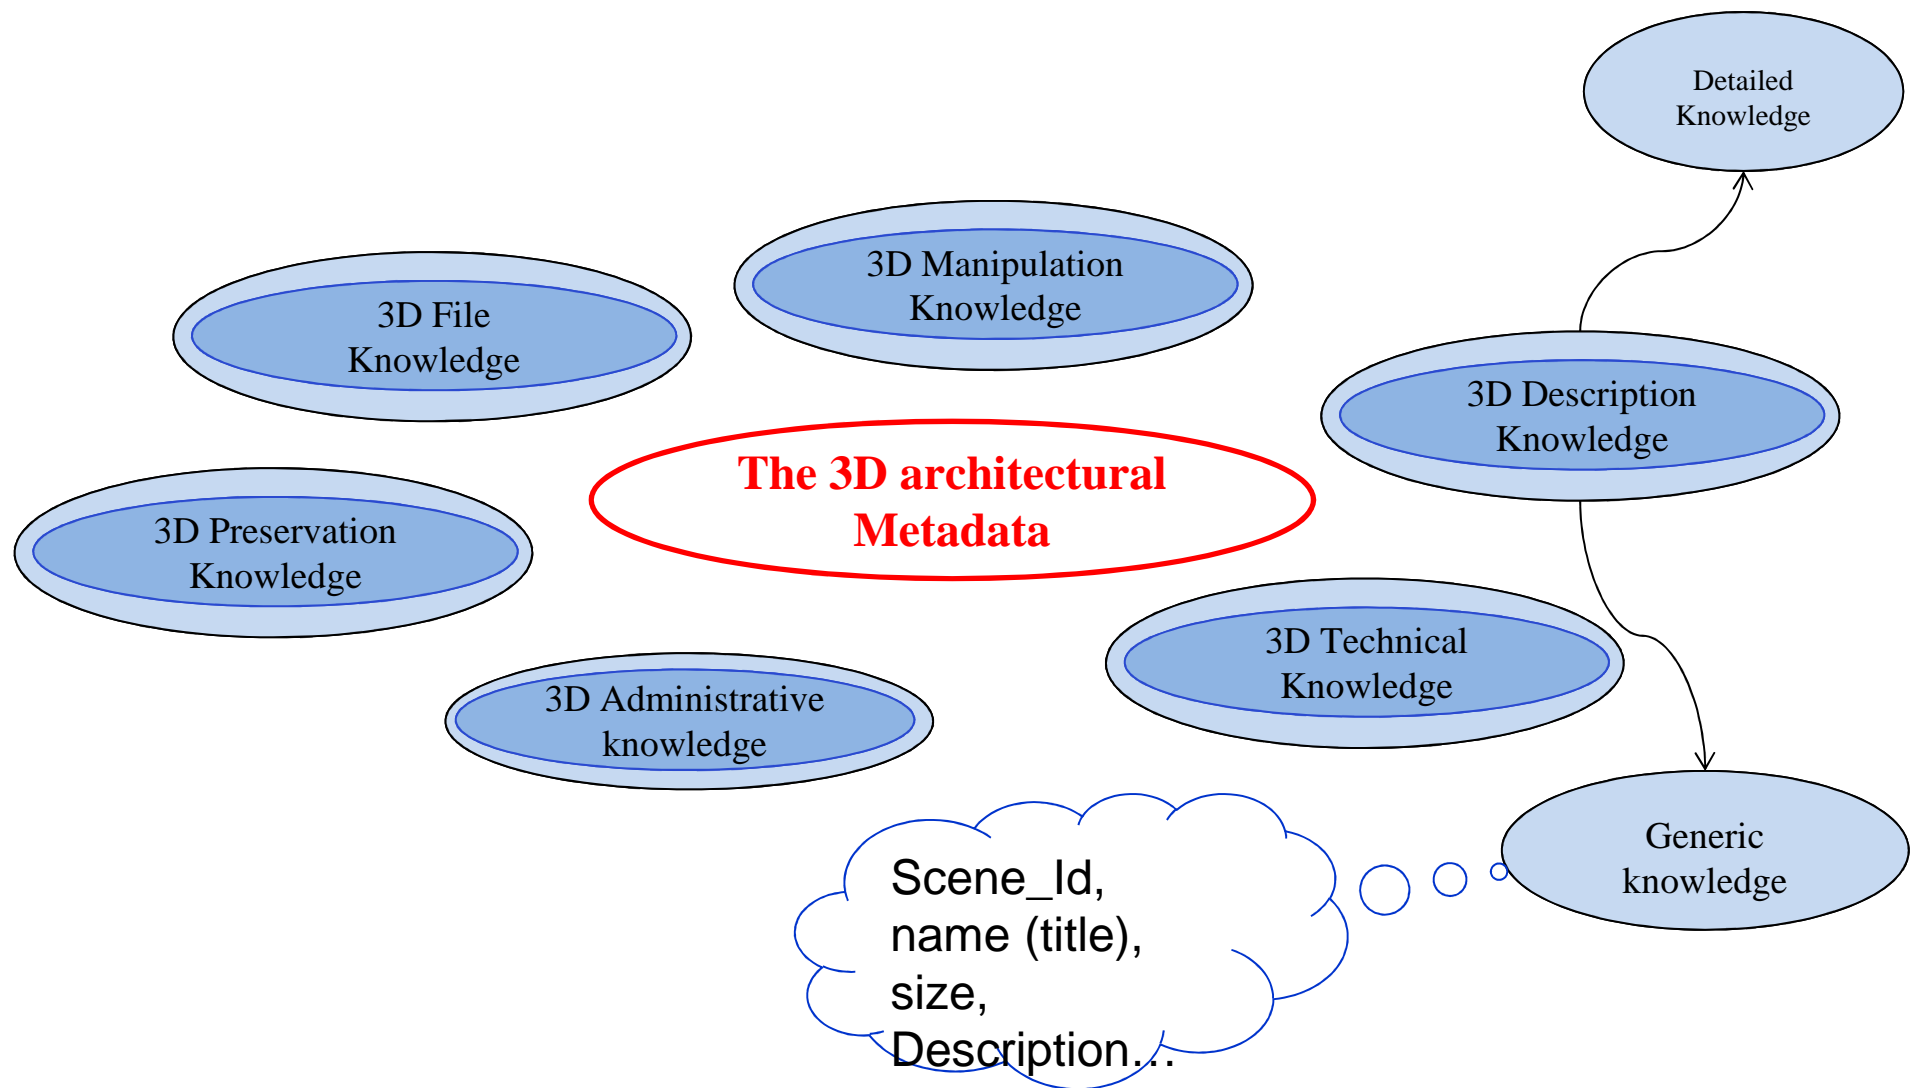

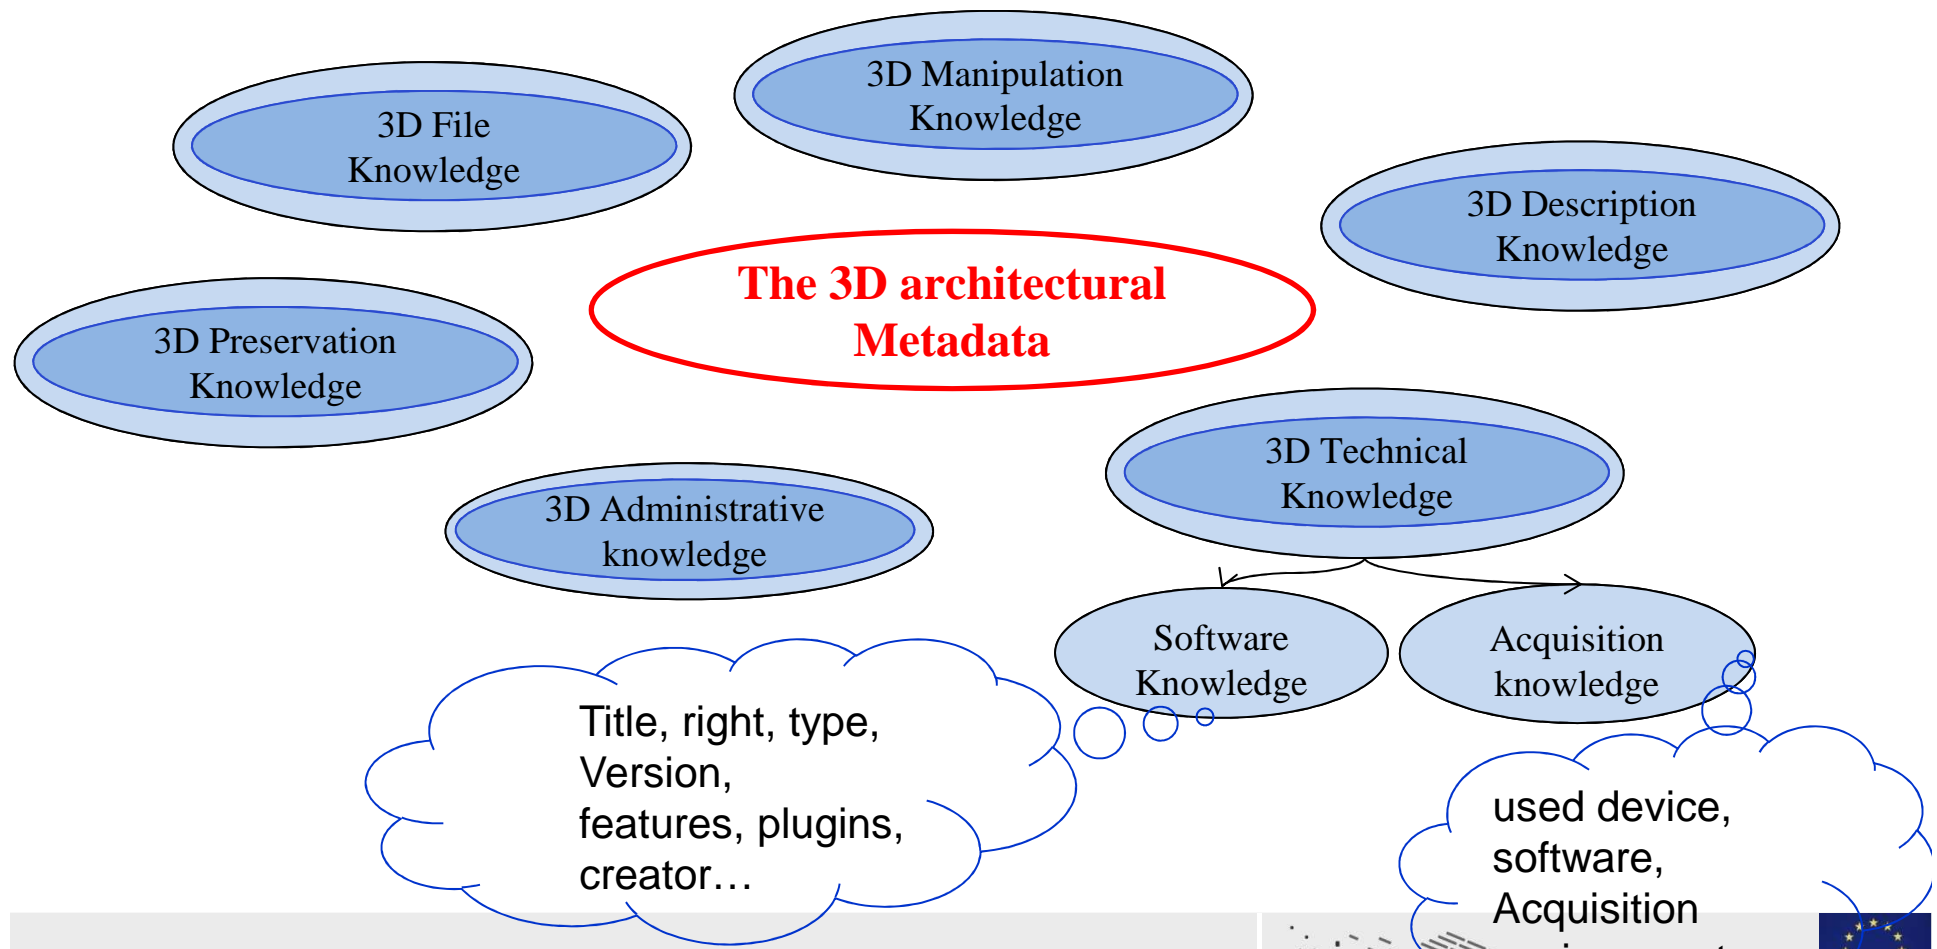

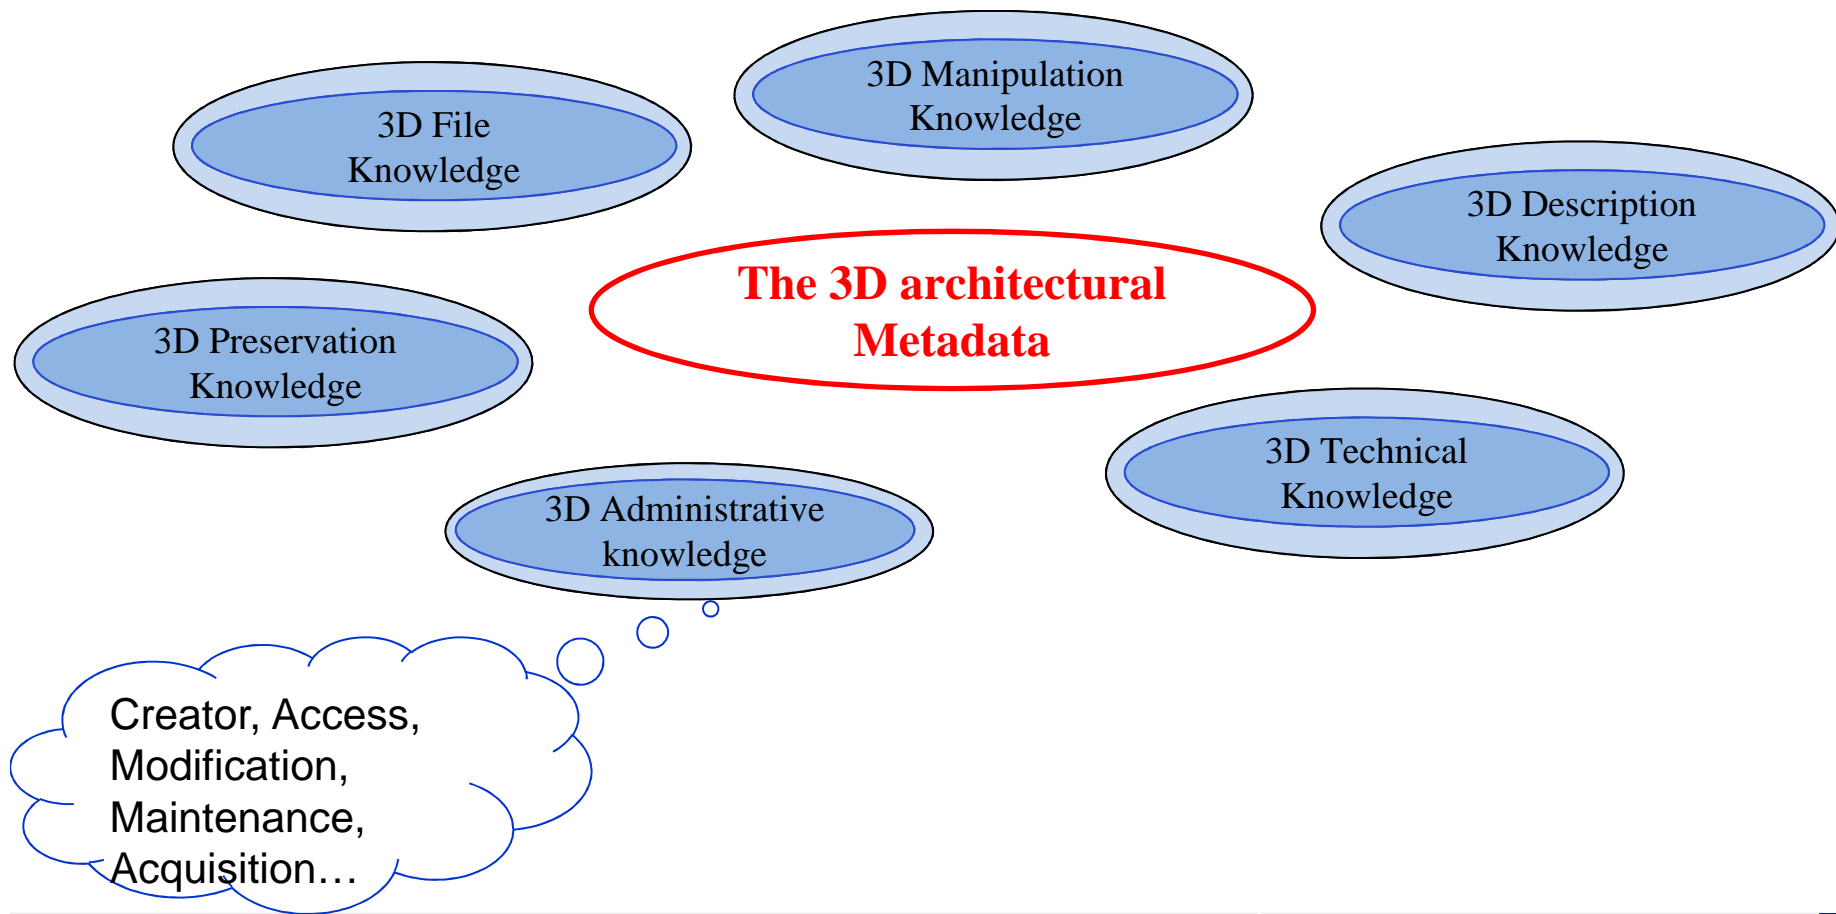

Issue

Issue

Use Cases

- **SME Use Case**
 - Fulfilling the needs of SME
 - Design Build and Retrofitting
- **Institutional Preservation Use Case**
 - Fulfilling the archival task of a research library
 - Provide better services for their academic and industrial customers.

Perspectives

- Integrate workflows for 3D data into TIB's productive digital preservation system based on the software Rosetta
- Support the ingest of architectural 3D data from the vast domains specific spectrum of semantic detail levels
 - Low-level point cloud scans over legacy 3D CAD models
 - highly enriched Building Information Modeling (BIM).
